

XHTML+RDFa 1.1 - Second Edition

Support for RDFa via XHTML Modularization

W3C Recommendation 22 August 2013

This version:

<http://www.w3.org/TR/2013/REC-xhtml-rdfa-20130822/>

Latest published version:

<http://www.w3.org/TR/xhtml-rdfa/>

Previous version:

<http://www.w3.org/TR/2012/REC-xhtml-rdfa-20120607/>

Latest recommendation:

<http://www.w3.org/TR/2012/REC-xhtml-rdfa-20120607/>

Editor:

Shane McCarron, Applied Testing and Technology, Inc., shane@aptest.com

Please refer to the **errata** for this document, which may include some normative corrections.

This document is also available in these non-normative formats: XHTML+RDFa, Diff from Previous Recommendation, Postscript version, and PDF version

The English version of this specification is the only normative version. Non-normative translations may also be available.

Abstract

RDFa Core 1.1 [*RDFA-CORE [p.61]*] defines attributes and syntax for embedding semantic markup in Host Languages. This document defines one such Host Language. This language is a superset of XHTML 1.1 [*XHTML 1.1-2e [p.61]*], integrating the attributes as defined in RDFa Core 1.1. This document is intended for authors who want to create XHTML Family documents that embed rich semantic markup.

Status of This Document

This section describes the status of this document at the time of its publication. Other documents may supersede this document. A list of current W3C publications and the latest revision of this technical report can be found in the W3C technical reports index at <http://www.w3.org/TR/>.

This document has been reviewed by W3C Members, by software developers, and by other W3C groups and interested parties, and is endorsed by the Director as a W3C Recommendation. It is a stable document and may be used as reference material or cited from another document. W3C's role in making the Recommendation is to draw attention to the specification and to promote its widespread deployment. This enhances the functionality and interoperability of the Web.

This version represents minor editorial changes and changes to references. No other changes were made from the original version of the Recommendation.

This is a revision of Sections 8 and 9 and Appendix A of RDFa Syntax 1.0 [*RDFA-SYNTAX [p.61]*]. This document supersedes those sections of the previous Recommendation. There are a number of substantive differences between this version and its predecessor, including:

1. Inheritance of basic processing rules from [*RDFA-CORE [p.61]*].
2. The inclusion of an implementation of the markup language using XML Schema.
3. The addition of @lang to be consistent with recent changes in [*XHTML 1.1-2e [p.61]*].
4. Removal of the collection of TERMS from this document - instead deferring the definitions in an RDFa Initial Context document.

A sample test harness is available. This set of tests is not intended to be exhaustive. Users may find the tests to be useful examples of RDFa usage.

The implementation report used by the director to transition to Recommendation has been made available. There have been no formal objections to the publication of this document.

This document was published by the RDF Web Applications Working Group as a Recommendation. If you wish to make comments regarding this document, please send them to public-rdfa@w3.org (subscribe, archives). All comments are welcome.

This document was produced by a group operating under the 5 February 2004 W3C Patent Policy. W3C maintains a public list of any patent disclosures made in connection with the deliverables of the group; that page also includes instructions for disclosing a patent. An individual who has actual knowledge of a patent which the individual believes contains Essential Claim(s) must disclose the information in accordance with section 6 of the W3C Patent Policy.

 - F.1 Normative references [p.61]
 - F.2 Informative references [p.61]

1. Introduction

XHTML+RDFa 1.1 is an XHTML Family markup language. It extends the XHTML 1.1 markup language with the attributes defined in RDFa Core 1.1. The document also defines an XHTML Modularization-compatible [*XHTML-MODULARIZATION11-2e [p.61]*] module for the RDFa Core attributes in both XML DTD and XML Schema formats.

2. Conformance

As well as sections marked as non-normative, all authoring guidelines, diagrams, examples, and notes in this specification are non-normative. Everything else in this specification is normative.

The key words *MUST*, *MUST NOT*, *REQUIRED*, *SHOULD*, *SHOULD NOT*, *RECOMMENDED*, *MAY*, and *OPTIONAL* in this specification are to be interpreted as described in [RFC2119 [p.61]].

2.1 Document Conformance

A strictly conforming XHTML+RDFa document is a document that requires only the facilities described as mandatory in this specification. Such a document satisfies the following criteria:

1. The document *MUST* conform to the constraints expressed in the schemas in Appendix A - XHTML+RDFa XML Schema [p.15] and Appendix B - XHTML+RDFa Document Type Definition [p.37].
2. The local part of the root element of the document *MUST* be `html`.
3. The start tag of the root element of the document *MUST* explicitly contain a default namespace declaration for the XHTML namespace [XML-NAMES11 [p.61]]. The namespace URI for XHTML is defined to be `http://www.w3.org/1999/xhtml`.

The start tag *MAY* also contain the declaration of the XML Schema Instance Namespace and an XML Schema Instance `schemaLocation` attribute [XMLSCHEMA11-2 [p.61]].

Such an attribute would associate the XHTML namespace

`http://www.w3.org/1999/xhtml` with the XML Schema at the URI

`http://www.w3.org/MarkUp/SCHEMA/xhtml-rdfa-2.xsd`.

4. There *MAY* Be a `@version` attribute on the `html` element with the value "XHTML+RDFa 1.1".

Example 1: Example of an XHTML+RDFa 1.1 document

```
<?xml version="1.0" encoding="UTF-8"?>
<html xmlns="http://www.w3.org/1999/xhtml"
      version="XHTML+RDFa 1.1"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:schemaLocation="http://www.w3.org/1999/xhtml
                        http://www.w3.org/MarkUp/SCHEMA/xhtml-rdfa-2.xsd"
      lang="en"
      xml:lang="en">
  <head>
    <title>Virtual Library</title>
  </head>
  <body>
    <p>Moved to <a href="http://example.org/">example.org</a>.</p>
  </body>
</html>
```

Note that in this example, the XML declaration is included. An XML declaration like the one above is not required in all XML documents. XHTML document authors *SHOULD* use XML declarations in all their documents. XHTML document authors *MUST* use an XML declaration when the character encoding of the document is other than the default UTF-8 or UTF-16 and no encoding is specified by a higher-level protocol.

XHTML+RDFa documents *SHOULD* be labeled with the Internet Media Type "application/xhtml+xml" as defined in [RFC3236 [p.61]]. For further information on using media types with XHTML Family markup languages, see the informative note [XHTML-MEDIA-TYPES [p.62]].

2.2 User Agent Conformance

A conforming user agent *MUST* support all of the features required in this specification. A conforming user agent must also support the User Agent conformance requirements as defined in XHTML Modularization [XHTML-MODULARIZATION11-2e [p.61]] section on "XHTML Family User Agent Conformance".

3. Additional RDFa Processing Rules

Documents conforming to the rules in this specification are processed according to [RDFa-CORE [p.61]] with the following extensions:

- The default vocabulary IRI is undefined.
- XHTML+RDFa uses an additional initial context by default, `http://www.w3.org/2011/rdfa-context/xhtml-rdfa-1.1`, which must be applied after the initial context for [RDFa-CORE [p.61]] (`http://www.w3.org/2011/rdfa-context/rdfa-1.1`).
- The base can be set using the `base` element as defined in [XHTML-MODULARIZATION11-2e [p.61]].
- The current language can be set using either the `@lang` or `@xml:lang` attributes.
- In section 7.5, processing step 5, if no IRI is provided by a resource attribute (e.g., `@about`, `@href`, `@resource`, or `@src`), then first check to see if the element is the `head` or `body` element. If it is, then act as if the new subject is set to the parent object.
- In section 7.5, processing step 6, if no IRI is provided by a resource attribute (e.g., `@about`, `@href`, `@resource`, or `@src`), then first check to see if the element is the `head` or `body` element. If it is, then act as if the new subject is set to the parent object.

When an XHTML+RDFa document uses `@version` on the `html` element, a conforming RDFa Processor *MUST* examine the value of this attribute. If the value matches that of a defined version of XHTML+RDFa, then the processing rules for that version *MUST* be used. If the value does not match a defined version, or there is no `@version` attribute, then the processing rules for the most recent version of XHTML+RDFa must be used.

4. XHTML+RDFa 1.1 Definition

The XHTML+RDFa 1.1 document type is a fully functional document type with rich semantics. It is a superset of [*XHTML 11-2e [p.61]*].

The XHTML+RDFa 1.1 document type is made up of the following XHTML modules. The elements, attributes, and content models associated with these modules are defined in "XHTML Modularization" [*XHTML-MODULARIZATION 11-2e [p.61]*]. The elements are listed here for information purposes, but the definitions in XHTML Modularization should be considered authoritative.

Structure Module

body, head, html, title.

Text Module

abbr, acronym, address, blockquote, br, cite, code, dfn, div, em, h1, h2, h3, h4, h5, h6, kbd, p, pre, q, samp, span, strong, var

Hypertext Module

a. @href is available on all elements.

List Module

dl, dt, dd, ol, ul, li

Object Module

object, param

Presentation Module

b, big, hr, i, small, sub, sup, tt

Edit Module

del, ins

Bidirectional Text Module

bdo

Forms Module

button, fieldset, form, input, label, legend, select, optgroup, option, textarea

Table Module

caption, col, colgroup, table, tbody, td, tfoot, th, thead, tr

Image Module

img

Client-side Image Map Module

area, map

Server-side Image Map Module

Attribute ismap on img

Intrinsic Events Module

Events attributes

Metainformation Module

meta

Scripting Module

noscript, script

Stylesheet Module

`style` elementStyle Attribute Module *Deprecated*`@style`

Target Module

`@target`

Link Module

`link`

Base Module

`base`

Metainformation Attributes Module [p.13]

`@about`, `@content`, `@datatype`, `@typeof`, `@prefix`, `@property`, `@rel`, `@resource`, `@rev`,
`@vocab` are available on all elements.Ruby Annotation Module from [*RUBY* [p.61]]`ruby`, `rbc`, `rtc`, `rb`, `rt`, `rp`

This specification also adds the `lang` attribute to the I18N attribute collection as defined in [*XHTML-MODULARIZATION11-2e* [p.61]]. The `lang` attribute is defined in [*HTML401* [p.61]]. When this attribute and the `xml:lang` attribute are specified on the same element, the `xml:lang` attribute takes precedence. When both `lang` and `xml:lang` are specified on the same element, they *MUST* have the same value.

There are no additional definitions required by this document type. An implementation of this document type as an XML Schema is defined in Appendix A [p.15] , and as an XML DTD is defined in Appendix B [p.37] .

5. Metainformation Attributes Module

The Metainformation Attributes Module defines the `Metainformation` attribute collection in the format required by [XHTML-MODULARIZATION11-2e [p.61]]. This collection allows elements to be annotated with metadata throughout an XHTML Family document. When this module is included in a markup language, this collection is added to the `Common` attribute collection as defined in [XHTML-MODULARIZATION11-2e [p.61]].

5.1 Metainformation Attributes Collection

The following attributes are included in the attribute collection, and take values in the associated datatype:

Metainformation Attribute Collection

Attributes	Notes
<code>about</code> (SafeCURIEorCURIEorIRI)	
<code>content</code> (CDATA)	
<code>datatype</code> (TERMorCURIEorAbsIRI)	If not specified, then the default value is <code>string</code> as defined in [XMLSCHEMA11-2 [p.61]].
<code>prefix</code> (NCName ':' IRI)+	
<code>property</code> (TERMorCURIEorAbsIRIs)	
<code>rel</code> (TERMorCURIEorAbsIRIs)	
<code>resource</code> (SafeCURIEorCURIEorIRI)	
<code>rev</code> (TERMorCURIEorAbsIRIs)	
<code>typeof</code> (TERMorCURIEorAbsIRIs)	
<code>vocab</code> (IRI)	An IRI that defines the prefix to use when a CURIE is specified with no prefix and no colon.

An implementation of this module in XML Schema can be found in Appendix A [p.15] and in XML DTD in Appendix B [p.37] .

5.2 XHTML RDFa Initial Context

This section is non-normative.

This specification defines an RDFa Initial Context. It is available at <http://www.w3.org/2011/rdfa-context/xhtml-rdfa-1.1>.

A. XHTML+RDFa XML Schema

This appendix is *normative*.

This appendix includes an implementation of the XHTML+RDFa 1.1 language using XML Schema. It is implemented by combining the XHTML 1.1 Schema with the XHTML Metainformation Attribute Module. This is done by using a content model module, and then a driver module. There are direct links to the various files for download purposes. Please note that the files targeted by the "latest version" links may change slowly over time. See the W3C XHTML2 Working Group home page for more information.

A.1 XHTML Metainformation Attributes Module

You can download this version of this file from SCHEMA/xhtmll-metaAttributes-2.xsd. The latest version is available at <http://www.w3.org/MarkUp/SCHEMA/xhtmll-metaAttributes-2.xsd>.

    </xs:documentation>
    <xs:documentation source="xhtml-copyright-1.xsd"/>
  </xs:annotation>
  <xs:annotation>
    <xs:documentation>
      XHTML Document Model
      This module describes the groupings of elements/attributes
      that make up common content models for XHTML elements.
      XHTML has following basic content models:
        xhtml.Inline.mix; character-level elements
        xhtml.Block.mix; block-like elements, e.g., paragraphs and lists
        xhtml.Flow.mix; any block or inline elements
        xhtml.HeadOpts.mix; Head Elements
        xhtml.InlinePre.mix; Special class for pre content model
        xhtml.InlineNoAnchor.mix; Content model for Anchor

      Any groups declared in this module may be used to create
      element content models, but the above are considered 'global'
      (insofar as that term applies here). XHTML has the
      following Attribute Groups
        xhtml.Core.extra.attrib
        xhtml.I18n.extra.attrib
        xhtml.Common.extra
    </xs:documentation>
  </xs:annotation>

```

```

        The above attribute Groups are considered Global

B. XHTML+RDFa Document Type Definition

This appendix includes an implementation of the XHTML+RDFa 1.1 language as an XML DTD. It is implemented by combining the XHTML 1.1 DTD with the XHTML Metainformation Attribute Module. This is done by using a content model module, and then a driver module. There are direct links to the various files for download purposes. Please note that the files targeted by the "latest version" links may change slowly over time. See the W3C XHTML2 Working Group home page for more information.

B.1 XHTML Metainformation Attributes Module

You can download this version of this file from DTD/xhtml-metaAttributes-2.mod. The latest version is available at <http://www.w3.org/MarkUp/DTD/xhtml-metaAttributes-2.mod>.

```

B.2 XHTML+RDFa Content Model Module

You can download this version of this file from DTD/xhtml-rdfa-model-2.mod. The latest version is available at <http://www.w3.org/MarkUp/DTD/xhtml-rdfa-model-2.mod>.

```

<!-- ..... -->
<!-- XHTML+RDFa Document Model Module ..... -->
<!-- file: xhtml-rdfa-model-2.mod

This is XHTML+RDFa.
Copyright 1998-2010 W3C (MIT, ERCIM, Keio), All Rights Reserved.
Revision: $Id: Overview.html,v 1.78 2013-08-14 15:21:52 smccarro Exp $ SMI

This DTD module is identified by the PUBLIC and SYSTEM identifiers:

PUBLIC "-//W3C//ENTITIES XHTML+RDFa Document Model 1.1//EN"
SYSTEM "http://www.w3.org/MarkUp/DTD/xhtml-rdfa-model-2.mod"

Revisions:
(none)
..... -->

<!-- XHTML+RDFa Document Model

```

This module describes the groupings of elements that make up common content models for XHTML elements.

XHTML has three basic content models:

```
%Inline.mix;  character-level elements
%Block.mix;   block-like elements, eg., paragraphs and lists
%Flow.mix;    any block or inline elements
```

Any parameter entities declared in this module may be used to create element content models, but the above three are considered 'global' (insofar as that term applies here).

The reserved word '#PCDATA' (indicating a text string) is now included explicitly with each element declaration that is declared as mixed content, as XML requires that this token occur first in a content model specification.

```
-->
```

```
<!-- Extending the Model
```

While in some cases this module may need to be rewritten to accommodate changes to the document model, minor extensions may be accomplished by redeclaring any of the three *.extra; parameter entities to contain extension element types as follows:

```
%Misc.extra;   whose parent may be any block or
                inline element.

%Inline.extra;  whose parent may be any inline element.

%Block.extra;   whose parent may be any block element.
```

If used, these parameter entities must be an OR-separated list beginning with an OR separator ("|"), eg., "| a | b | c"

All block and inline *.class parameter entities not part of the *struct.class classes begin with "| " to allow for exclusion from mixes.

```
-->
```

```
<!-- ..... Optional Elements in head ..... -->
```

```
<!ENTITY % HeadOpts.mix
"( %script.qname; | %style.qname; | %meta.qname;
  | %link.qname; | %object.qname; )*"
>
```

```
<!-- ..... Miscellaneous Elements ..... -->
```

```
<!-- ins and del are used to denote editing changes
-->
<!ENTITY % Edit.class "| %ins.qname; | %del.qname;" >
```

```
<!-- script and noscript are used to contain scripts
and alternative content
-->
```

```

<!ENTITY % Script.class "| %script.qname; | %noscript.qname;" >

<!ENTITY % Misc.extra "" >

<!-- These elements are neither block nor inline, and can
      essentially be used anywhere in the document body.
-->
<!ENTITY % Misc.class
      "%Edit.class;

B.4 SGML Open Catalog Entry for XHTML+RDFa

This section contains the SGML Open Catalog-format definition [SGML-CATALOG [p.62]] of the public identifiers for XHTML+RDFa 1.1.

You can download this version of this file from DTD/xhtml-rdfa.cat. The latest version is available at <http://www.w3.org/MarkUp/DTD/xhtml-rdfa.cat>.

```

```

C. Deployment Advice

This section is non-normative.

Documents written using the markup language defined in this specification can be validated using the DTD defined in Appendix B [p.37] . If a document author wants to facilitate such validation, they may include the following declaration at the top of their document:

Example 2

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML+RDFa 1.1//EN"
"http://www.w3.org/MarkUp/DTD/xhtml-rdfa-2.dtd">
```

The XML Namespace document associated with the XHTML Family of markup languages uses the mechanism for transforming XHTML+RDFa documents into RDF as defined by [GRDDL [p.61]]. Authors who want to be certain their documents are transformable by all [GRDDL [p.61]] processors may also include a `profile` attribute on the `head` element that includes a reference to the RDFa Initial Context IRI
`http://www.w3.org/2011/rdfa-context/xhtml-rdfa-1.1.`

D. Change History

This section is non-normative.

2010-02-25: First version of the split-out XHTML specialization.

E. Acknowledgments

This section is non-normative.

At the time of publication, the members of the RDF Web Applications Working Group were:

- Stéphane Corlosquet, MIND Center for Interdisciplinary Informatics
- Ivan Herman, W3C
- Gregg Kellogg (Invited Expert)
- Niklas Lindström (Invited Expert)
- Shane McCarron, Applied Testing and Technology, Inc. (Invited Expert)
- Steven Pemberton, Centre for Mathematics and Computer Science (CWI)
- Manu Sporny, Digital Bazaar (Chair, Invited Expert)
